

Your updated WhatsApp messaging journey

A plain-language guide for the team

Implementation status: This guide describes the updated system. Deployment, template verification and live delivery checks are still required.

One product. Clear choices.

The journey centres on **Velvety Butter Chicken Liquid Spice**. Customers can move between cooking, shopping, tracking and support using buttons, including buttons from an older conversation.

1. Welcome and main menu

When a customer sends **Hi** or **Hello**, they receive five choices: **Cook Butter Chicken**, **Explore the product**, **Order online**, **Track an order** and **Customer Care**.

Main menu and **Back** help customers navigate.

2. Explore and order

Explore product opens the product image and description, followed by three buttons.

- **Start cooking:** opens the cooking tutorial.
- **Order online:** sends the website link directly to the Velvety Butter Chicken section.
- **Back:** returns to the main menu.

There is no product-selection stage.

Cooking, feedback & help

3. Cooking and feedback

Start cooking, **Cooking Video**, **Watch Video**, **Watch cooking demo** and **VIDEO** all lead to the same tutorial.

After the video, an optional **Done** button appears. There are no step-by-step cooking messages.

- **Customer taps Done:** receives an acknowledgment; feedback is scheduled for about 30 minutes later.
- **Customer does not tap Done:** a feedback check-in is scheduled about 30 minutes after the tutorial.
- **Customer leaves the cooking journey:** the old feedback reminder is cancelled.

The feedback choices are **Loved it**, which receives a positive response and review link, and **Could be better**, which receives an improvement-focused response and review link.

If the bot cannot find the customer's order, it explains that and offers help.

4. Opening the lid

How to open the lid? sends the dedicated lid-opening video. Customers can use this button while they are in another conversation flow.

5. Customer Care

Need Help asks the customer to describe the issue. The system saves a support case and sends the customer a reference number.

Both authorized admins receive an alert. A description containing words such as “need help” or “customer care” is treated as the issue, rather than restarting the conversation.

6. Order tracking

Track an order asks for the order number, then returns the order's status.

If the number is missing, **Help** asks for the registered phone number and delivery pincode. The customer can recover their order or request Customer Care.

Customers cannot retrieve another customer's private order details.

Order updates & the admin team

7. Order messages and reminders

The system sends relevant updates as customers progress through shopping and cooking.

What happens	WhatsApp response
Customer leaves checkout after entering details	Checkout reminder scheduled after 1 hour
Prepaid order is confirmed	Payment/order confirmation
COD order is placed	COD confirmation
Admin updates fulfilment	Order-status update
Admin marks Delivered	Dedicated delivered invitation after 15 minutes
Customer requests a cooking reminder	Reminder for their selected time
Customer taps Rate VALOUR	Review link
Customer taps Not now	Queued review reminder is cancelled
Reorder reminder becomes due	Reminder after 7 days, subject to eligibility

The delivered invitation respects **9 a.m.-8 p.m. India time**. Marketing reminders also follow sending-hour and frequency limits. Obsolete reminders are cancelled when customers progress, such as checkout reminders after payment.

8. The admin experience

Only **+91 70053 28132** and **+91 92330 54806** can access WhatsApp admin functions.

Admins receive new-order and support alerts. They can open **Recent orders**, select an order and return to the list.

Using a case reference, admins can check status, mark pending, resolve or reopen a support case.

What should feel better now

Old buttons lead to the right place, customers can switch tasks without getting stuck, and repeated delivery of the same incoming message does not create duplicate replies or cases.

The dashboard distinguishes **Submitted**, **Sent**, **Delivered** and **Read**. If delivery is uncertain, it flags the message for checking instead of blindly sending it again.
